A fundamental problem in neuroscience is the elucidation of the cellular and molecular mechanisms underlying the development and function of the nervous system. The complexity of organization, the heterogeneity of cell types and their interactions, and the difficulty of controlling experimental variables in intact organisms make this a formidable task. Because of the ability that it affords to analyze smaller components of the nervous system (even single cells in some cases) and to better control experimental variables, cell culture has become an increasingly valuable tool for neuroscientists. Many aspects of neural development, such as proliferation, differentiation, synaptogenesis, and myelination, occur in culture with time courses remarkably similar to those in vivo. Thus, in vitro methods often provide excellent model systems for investigating neurobiological questions. Ross Harrison described the first culture of neural tissue in 1907 and

used morphological methods to analyze the cultures. Since that time the technique has been progressively modified and used to address an ever widening range of developmental questions. In recent years a convergence of new or improved cell culture, biochemical, electrophysiological, and immunological methods has occurred and been brought to bear on neurobiological questions. This volume is intended not to be comprehensive but rather to highlight some of the latest findings, with a review of previous important work as well, in which combinations of these methods are used.

Literature begins at Sumer, we may say. Given that this ancient crossroads of tin and copper produced not only bronze and the entire Bronze Age, but also by necessity, the first system of record-keeping and the technique of writing. Scribal schools served to propagate the new technique and their curriculum grew to create, preserve and transmit all manner of creative poetry. In a lifetime of research, the author has studied multiple aspects of this most ancient literary oeuvre, including such questions as chronology and bilingualism, as well as contributing

fundamental insights into specific genres such as proverbs, letter-prayers and lamentations. In addition, he has drawn conclusions for the comparative or contextual approach to biblical literature. His studies, widely scattered in diverse publications for nearly fifty years, are here assembled in convenient one-volume format, made more user-friendly by extensive cross-references and indices.

Cell surface molecules are critically important in regulating cell structure and function. Recent advances on the functional role of cell surface molecules, particularly glycoconjugates are presented in this book. Comprising of 22 chapters from the 2011 International Symposium on Biochemical Roles of Eukaryotic Cell Surface Macromolecules, it covers topics on the analysis of glycome, biophysical approaches to study cell surface molecules, glycoconjugate metabolism and its dysregulation, and molecular mechanisms involved in cell-cell and cell-matrix interaction.

Discussion of the nature of Sumerian wisdom literature and complete editions of many Sumerian

wisdom texts, including the Instructions of Shuruppak, Instructions of Ur-Ninurta, Counsels of Wisdom, Sumerian fables, Nothing Is of Value, Ballade of Early Rulers, and more. This unusual book describes the Sumerian literature and many of their proverbs featured in speeches of wise men of that time.

Mesopotamian anti-witchcraft rituals and prescriptions prescribe ceremonies and treatments for dispelling witchcraft, destroying the witch, and protecting and curing the patient. The Corpus of Mesopotamian Anti-Witchcraft Rituals aims to present a reconstruction and critical editions of this body of texts.

This collection of essays honors the life and work of Gary Beckman, Professor of Hittite and Mesopotamian Studies at the University of Michigan. The essays were contributed by his colleagues, students, and friends, and their breadth-traversing ancient Anatolia, Syria, Mesopotamia, and beyond-are a measure of the range of his influence as a scholar. His interest in the reception and adaptation of Syro-Mesopotamian culture by the Hittites in particular inspired this offering.

Few compositions provide as much insight into the structure of the Hittite state and the nature of Hittite society as the so-called Instructions. While these texts may strike the modern reader as

didactic, the Hittites, who categorized them together with state treaties, understood them as “contracts” or “obligations,” consisting of the king’s instructions to officials such as priests and temple personnel, mayors, military officers, border garrison commanders, and palace servants. They detail how and in what spirit the officials are to carry out their duties and what consequences they are to suffer for failure. Also included are several examples of closely related oath impositions and oaths. Collecting for the first time the entire corpus of Hittite Instructions, this accessible volume presents these works in transliteration of the original texts and translation, with clear and readable introductory essays, references to primary and secondary sources, and thorough indices. *A Universal and Critical Dictionary of the English Language* Society of Biblical Lit  
Pharmaceutical Biotechnology offers students taking Pharmacy and related Medical and Pharmaceutical courses a comprehensive introduction to the fast-moving area of biopharmaceuticals. With a particular focus on the subject taken from a pharmaceutical perspective, initial chapters offer a broad introduction to protein science and recombinant DNA technology- key areas that underpin the whole subject. Subsequent chapters focus upon the development, production and analysis of these substances. Finally the book moves on to explore the science, biotechnology and medical applications of specific biotech products categories. These include not only protein-based substances but also nucleic acid and cell-based products. introduces essential principles underlining modern biotechnology- recombinant DNA technology and protein science an invaluable introduction to this fast-moving subject aimed specifically at pharmacy and medical students includes specific ‘product category chapters’ focusing on the pharmaceutical, medical and therapeutic properties of numerous biopharmaceutical products. entire chapter devoted to the principles of genetic engineering and how these drugs are developed. includes numerous relevant case studies to enhance student understanding no prior knowledge of protein structure is assumed

The main purpose of the book is to describe the Efate language. Comparison is made with other languages in order to elucidate certain aspects of Efate or as evidence in support of the author’s theory that the Oceanic languages have their origin in Semitic.
